

Input and Variables Assignment

Modify the Language Intro assignment's word-guessing program as follows:

- When inputting the user's guess, call the `input()` function with a string argument that prompts the user for their guess. That is, do not use a separate `print()` function call to prompt the user.
- Use a single `print()` function call to output congratulations to the user on one line and output the message of the form "You used 5 guesses." on the next line.
- Do not use `format()` to produce the message of the form "You used 5 guesses." Instead, use string concatenation and/or multiple arguments in your call to the `print()` function.
- Following the "You used 5 guesses." message, output a message of the form
Your incorrect guesses were oh dear me no
where the guessed words should appear in the order in which they were entered by the user.

Grading

5: Program runs and conforms perfectly with specifications above

4: Program runs and is mostly correct but deviates from the above specification in one way

3: Program runs and is mostly correct but deviates from the above specification in two or more ways

0: Program does not run or deviates from the above specification in two or more ways
